

How to create auto scaling group

1. In Aws console scroll and find Auto scaling group.
2. Click Auto scaling group , and click create auto scaling group.

3. First we must create Launch template.
4. In launch Template, you click create a launch template.

5. In Menu create launch template, you can fill launch template name.

6. Template version description (this is optional).

Create launch template

Creating a launch template allows you to create a saved instance configuration that can be reused, shared and launched at a later time. Templates can have multiple versions.

Launch template name and description

Launch template name - *required*

ASGtemplate

Must be unique to this account. Max 128 chars. No spaces or special characters like '&', '*', '@'.

Template version description

A prod webserver for MyApp

Max 255 chars

Auto Scaling guidance | [Info](#)

Select this if you intend to use this template with EC2 Auto Scaling

☒ Provide guidance to help me set up a template that I can use with EC2 Auto Scaling

► **Template tags**

► **Source template**

7. In Application and OS Images (Amazon Machine Image) , chose amazon linux.

8. Select instance type T3 micro (im using free tier).

9. In network setting , select existing security group , and select you security group (remember you already have one and if you don't have one , you can create new).

10. Click Advance detail , and scroll to bottom.

11. In User data you can write :

```
#!/bin/bash
yum update -y
yum install httpd -y
systemctl start httpd
systemctl enable httpd
echo "<h1>Server Auto Scalling</h1>"> /var/www/html/index.html

(but if you have another code you can use it)
```

12. Create Launch Template.

13. Then you will see you template.

Virtualization: hvm - ENA enabled: true - Root device type: ebs

Description

Amazon Linux 2023 (kernel-6.1) is a modern, general purpose Linux-based OS that comes with 5 years of long term support. It is optimized for AWS and designed to provide a secure, stable and high-performance execution environment to develop and run your cloud applications.

Create launch template

14. Then back to menu create template.

15. In Launch template , chose the template that you have made before.

16. In network , select vpc that you have already created.

17. In availability zone and subnet , choose the subnet you that have.

18. Select Balanced best effort , then next.

Network [Info](#)

For most applications, you can use multiple Availability Zones and let EC2 Auto Scaling balance your instances across the zones. The default VPC and default subnets are suitable for getting started quickly.

VPC
Choose the VPC that defines the virtual network for your Auto Scaling group.

vpc-0f6a8f24312c30aaa (vpc-website)
10.0.0.0/16

[Create a VPC](#)

Availability Zones and subnets
Define which Availability Zones and subnets your Auto Scaling group can use in the chosen VPC.

Select Availability Zones and subnets

apse2-az1 (ap-southeast-2a) | subnet-025d371de377cb929 (subnet-website-01)
10.0.0.0/24

apse2-az2 (ap-southeast-2c) | subnet-0d65b95e03d1f64b2 (subnet-website-02)
10.0.0.0/24

[Create a subnet](#)

Availability Zone distribution - new
Auto Scaling automatically balances instances across Availability Zones. If launch failures occur in a zone, select a strategy.

☒ **Balanced best effort**
If launches fail in one Availability Zone, Auto Scaling will attempt to launch in another healthy Availability Zone.

☐ **Balanced only**
If launches fail in one Availability Zone, Auto Scaling will continue to attempt to launch in the unhealthy Availability Zone to preserve balanced distribution.

19. In menu Integrate with other services , in load balancing select attach to an existing load balancer.

20. Select “Choose from your load balancer target group” , then select target group “websiteTarget | HTTP”

21. In health check , check the box turn on elastic load balancing health checks and turn on amazon ebs health check.

22. and health check grace period you can adjust it according your taste.

23. then next.

EC2 > Auto Scaling groups > Create Auto Scaling group

Step 1
● Choose launch template
Step 2
● Choose instance launch options
Step 3 - optional
● **Integrate with other services**
Step 4 - optional
● Configure group size and scaling
Step 5 - optional
● Add notifications
Step 6 - optional
● Add tags
Step 7
● Review

Integrate with other services - optional [Info](#)

Use a load balancer to distribute network traffic across multiple servers. Enable service-to-service communications with VPC Lattice. Shift resources away from impaired Availability Zones with zonal shift. You can also customize health check replacements and monitoring.

Load balancing [Info](#)

Use the options below to attach your Auto Scaling group to an existing load balancer, or to a new load balancer that you define.

Select Load balancing options

☐ No load balancer
Traffic to your Auto Scaling group will not be fronted by a load balancer.

☒ **Attach to an existing load balancer**
Choose from your existing load balancers.

☐ Attach to a new load balancer
Quickly create a basic load balancer to attach to your Auto Scaling group.

Attach to an existing load balancer

Select the load balancers to attach

☒ Choose from your load balancer target groups
This option allows you to attach Application, Network, or Gateway Load Balancers.

☐ Choose from Classic Load Balancers

Existing load balancer target groups
Only instance target groups that belong to the same VPC as your Auto Scaling group are available for selection.

Select target groups

websiteTarget | HTTP
Application Load Balancer: alb-website

Health checks

Health checks increase availability by replacing unhealthy instances. When you use multiple health checks, all are evaluated, and if at least one fails, instance replacement occurs.

EC2 health checks

[Always enabled](#)

Additional health check types - optional [Info](#)

☒ Turn on Elastic Load Balancing health checks **Recommended**

Elastic Load Balancing monitors whether instances are available to handle requests. When it reports an unhealthy instance, EC2 Auto Scaling can replace it on its next periodic check.

EC2 Auto Scaling will start to detect and act on health checks performed by Elastic Load Balancing. To avoid unexpected terminations, first verify the settings of these health checks in the [Load Balancer console](#).

☐ Turn on VPC Lattice health checks

VPC Lattice can monitor whether instances are available to handle requests. If it considers a target as failed a health check, EC2 Auto Scaling replaces it after its next periodic check.

☒ Turn on Amazon EBS health checks

EBS monitors whether an instance's root volume or attached volume stalls. When it reports an unhealthy volume, EC2 Auto Scaling can replace the instance on its next periodic health check.

EBS volumes that are attached to an instance have a DeleteOnTermination attribute. When instances are terminated, this attribute either detaches the volumes (keeping data intact), or deletes the volumes. Detached volumes are not reattached when a new instance starts. To avoid data loss, take frequent snapshots of any critical EBS volumes. You can automate snapshot creation and deletion with [Amazon Data Lifecycle Manager](#).

Health check grace period [Info](#)

This time period delays the first health check until your instances finish initializing. It doesn't prevent an instance from terminating when placed into a non-running state.

120 seconds

[Cancel](#)

[Skip to review](#)

[Previous](#)

[Next](#)

24. In scaling menu you can adjust scaling limits.

(Min desired capacity 2 and Max desired capacity 4)

25. Automatic scaling , select target tracking scaling policy.

26. Create scaling policy name , Metric type chose Average CPU Utilization and for target value create 50 and instance warmup 120.

27. let the rest default and then click next.

Scaling [Info](#)

You can resize your Auto Scaling group manually or automatically to meet changes in demand.

Scaling limits

Set limits on how much your desired capacity can be increased or decreased.

Min desired capacity

2

Equal or less than desired capacity

Max desired capacity

4

Equal or greater than desired capacity

Automatic scaling - optional

Choose whether to use a target tracking policy [Info](#)

You can set up other metric-based scaling policies and scheduled scaling after creating your Auto Scaling group.

☐ No scaling policies

Your Auto Scaling group will remain at its initial size and will not dynamically resize to meet demand.

☒ Target tracking scaling policy

Choose a CloudWatch metric and target value and let the scaling policy adjust the desired capacity in proportion to the metric's value.

Scaling policy name

Target Tracking Policy

Metric type [Info](#)

Monitored metric that determines if resource utilization is too low or high. If using EC2 metrics, consider enabling detailed monitoring for better scaling performance.

Average CPU utilization

Target value

50

Instance warmup [Info](#)

120 seconds

☐ Disable scale in to create only a scale-out policy

Additional settings

Instance scale-in protection

If protect from scale in is enabled, newly launched instances will be protected from scale in by default.

☐ Enable instance scale-in protection

Monitoring | [Info](#)

☐ Enable group metrics collection within CloudWatch

Default instance warmup | [Info](#)

The amount of time that CloudWatch metrics for new instances do not contribute to the group's aggregated instance metrics, as their usage data is not reliable yet.

☐ Enable default instance warmup

Auto Scaling group deletion protection - new | [Info](#)

Configure how this Auto Scaling group can be deleted.

☒ **None (default)**

The Auto Scaling group can be deleted.

☐ **Prevent force deletion**

The Auto Scaling group cannot be force deleted. To delete the group, all instances must be detached or terminated, and all warm pools must be deleted.

☐ **Prevent all deletion**

The Auto Scaling group cannot be deleted.

[Cancel](#) [Skip to review](#) [Previous](#) [Next](#)

28. Add notification , this is optional.

29. Notification 1 , create title topic notification will you receive and then fill your email and then next.

30. In menu add tags just leave default and click next.

Step 1 Choose launch template

Step 2 Choose instance launch options

Step 3 - optional Integrate with other services

Step 4 - optional Configure group size and scaling

Step 5 - optional **Add notifications**

Step 6 - optional Add tags

Step 7 Review

Add notifications - optional

Send notifications to SNS topics whenever Amazon EC2 Auto Scaling launches or terminates the EC2 instances in your Auto Scaling group.

- ☒ Replace root volume
- ☒ Fail to launch
- ☒ Fail to terminate
- ☒ Fail to replace root volume

[Add notification](#)

Add notifications

When you configure notifications, they help keep your users informed of changes by publishing to an Amazon SNS topic when selected events occur. For example, you can configure notifications when an instance launches or terminates. Notifications require an Amazon SNS topic and user subscriptions.

Each time that you create a new topic, check your email for a confirmation message, and click the link in the email to confirm your subscription. Notifications can only be sent to confirmed addresses.

33. In menu auto scaling group , click you auto scaling and then choose monitoring , in here you can monitoring your instance.

34. And you can go to activity bar for see activity history.

The screenshot shows the AWS Management Console for Auto Scaling groups in the Asia Pacific (Sydney) region. The left sidebar contains navigation links for EC2, Elastic Block Store, Network & Security, Load Balancing, and Auto Scaling. The main content area displays the 'Auto Scaling groups (1/1)' page. A table lists the 'ASGwebsite' group with details like launch template, instances, and capacity. Below the table, the 'Monitoring' tab is selected for the 'ASGwebsite' group. The 'CloudWatch monitoring details' section shows the 'Auto Scaling' tab with a checkbox to 'Enable' metrics collection. At the bottom, a secondary navigation bar includes links for Details, Integrations, Automatic scaling, Instance management, Instance refresh, Activity, Monitoring, and Tags.
